

Completing the monetary union

Luca Fantacci
Bocconi University

LSE, 21 March 2014

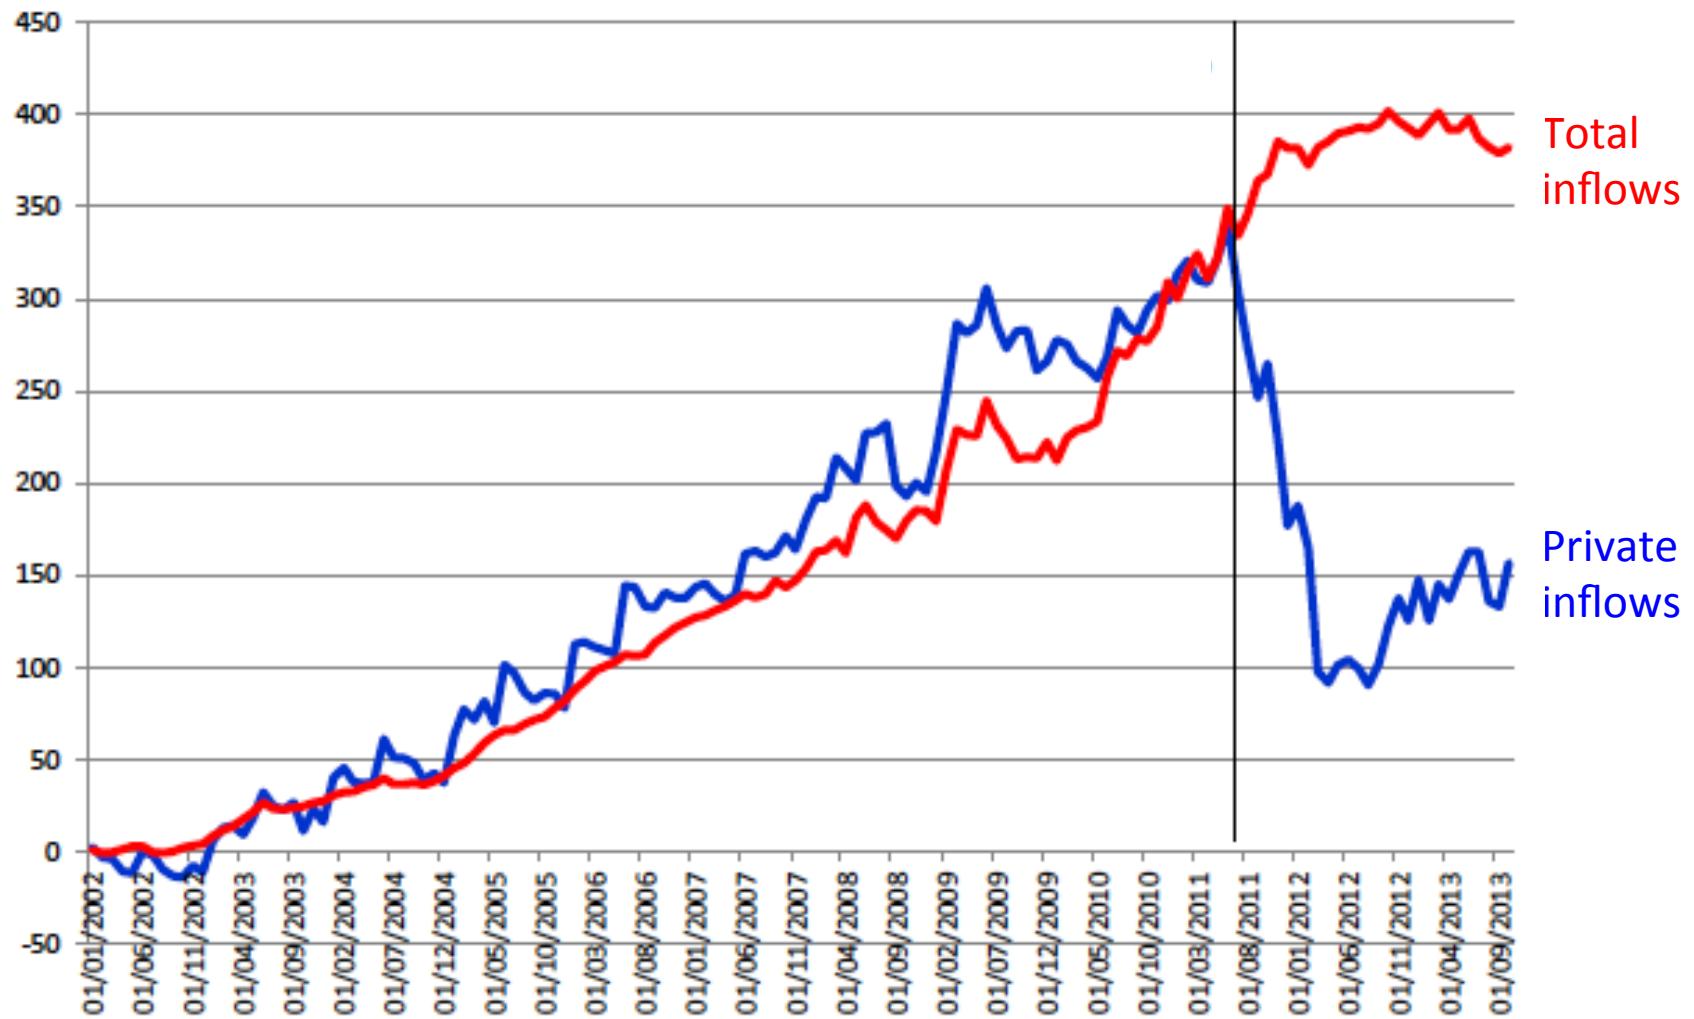

The “original sin” of the EMU

Current account imbalances (millions of euros)

Capital flights from the periphery

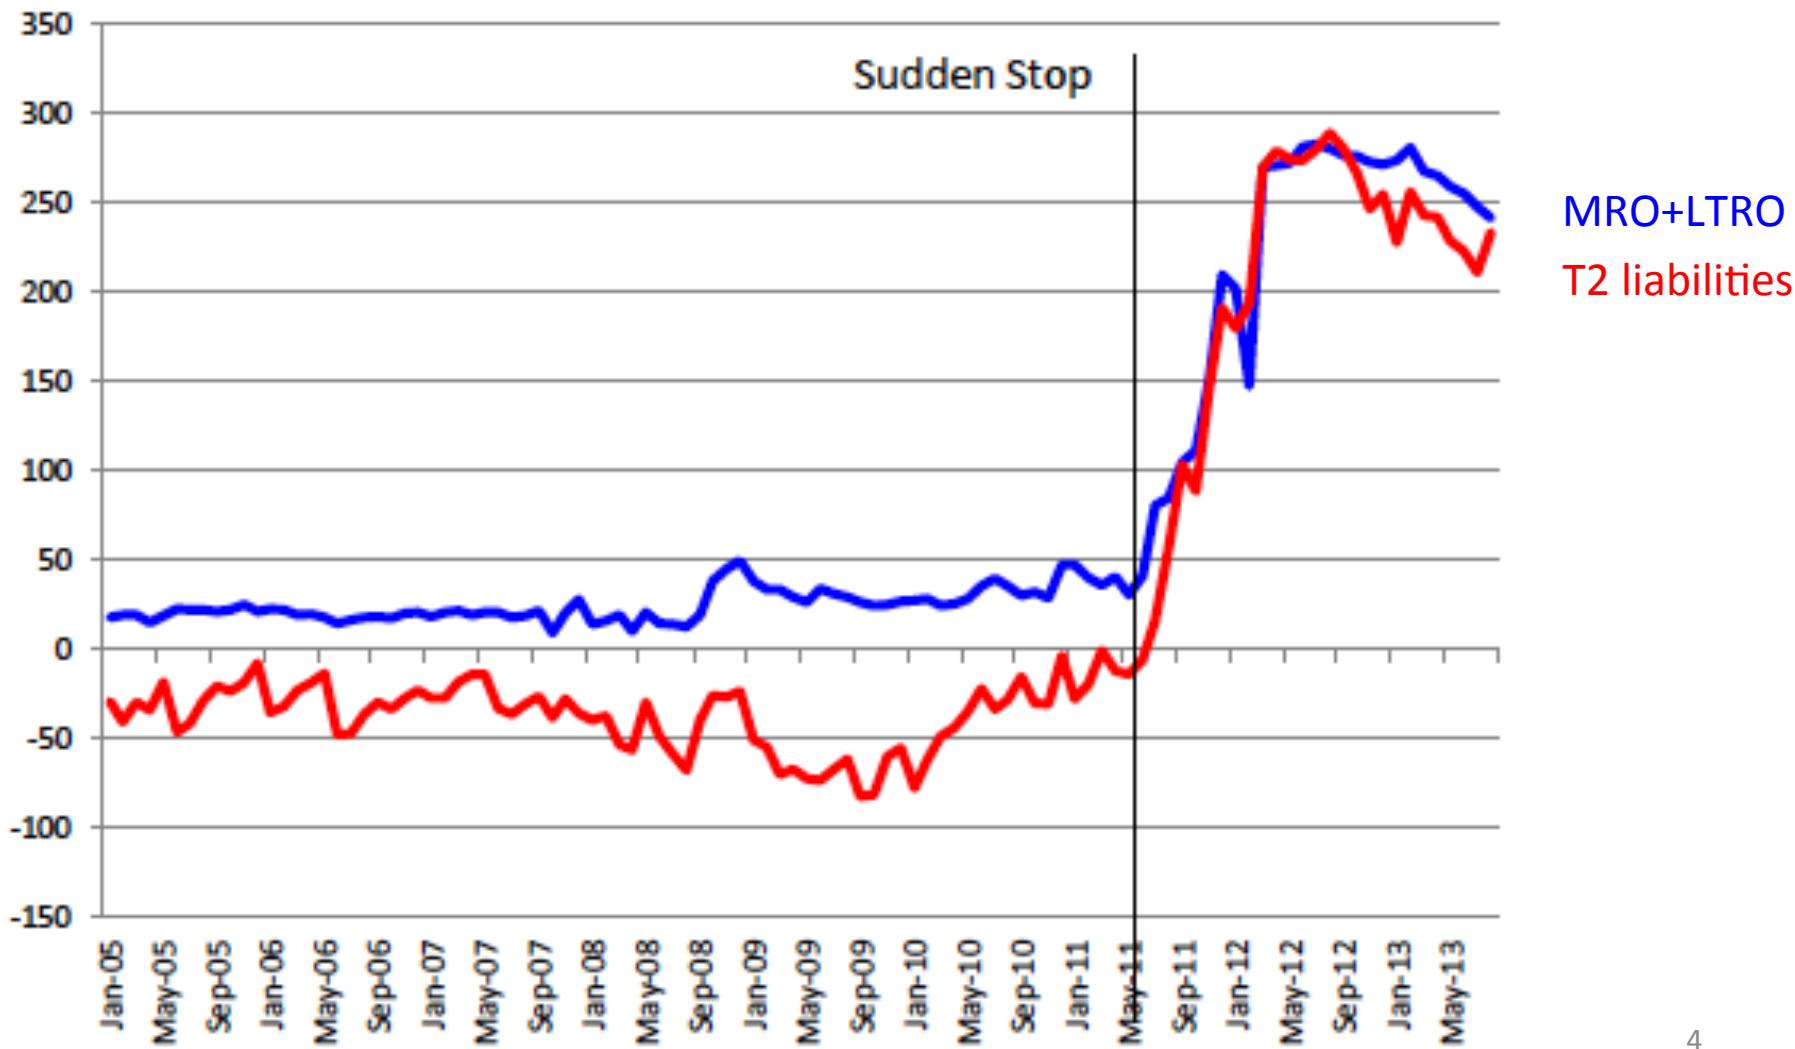

Italy, Cumulative financial account imbalances (millions of euros)

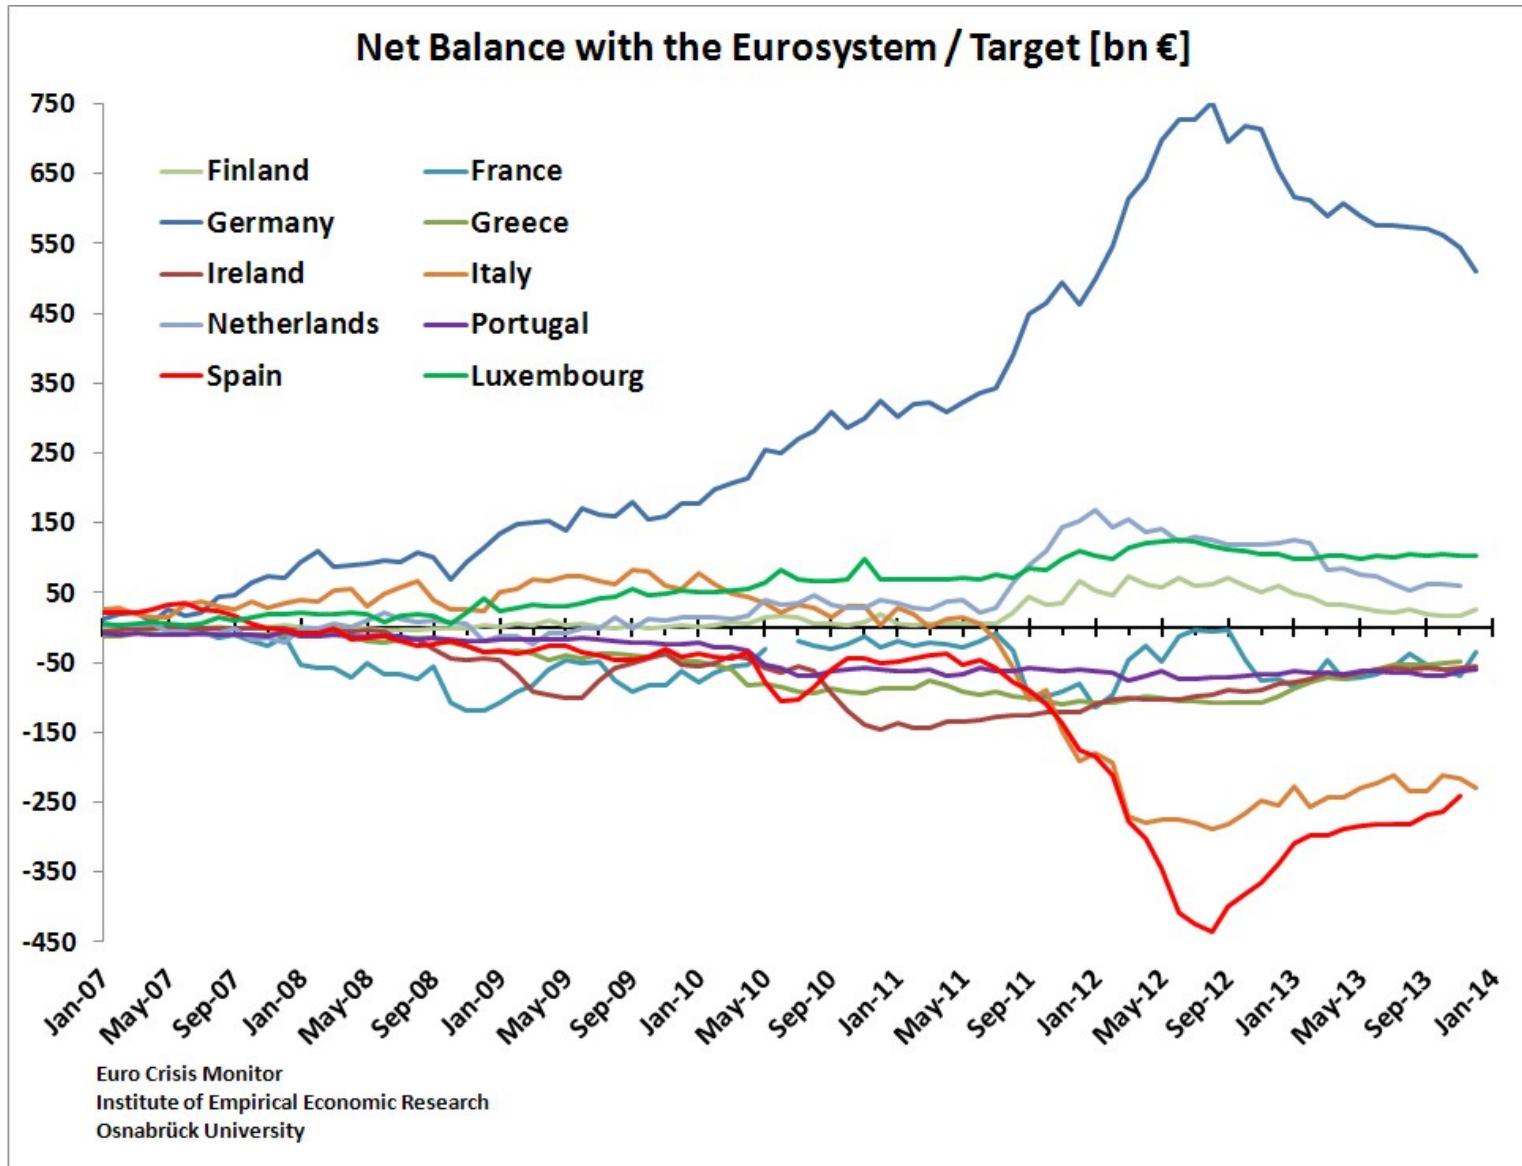

Source: Banca d'Italia

ECB to the rescue

Italy, ECB refinancing operations and target balances (billions of euros)

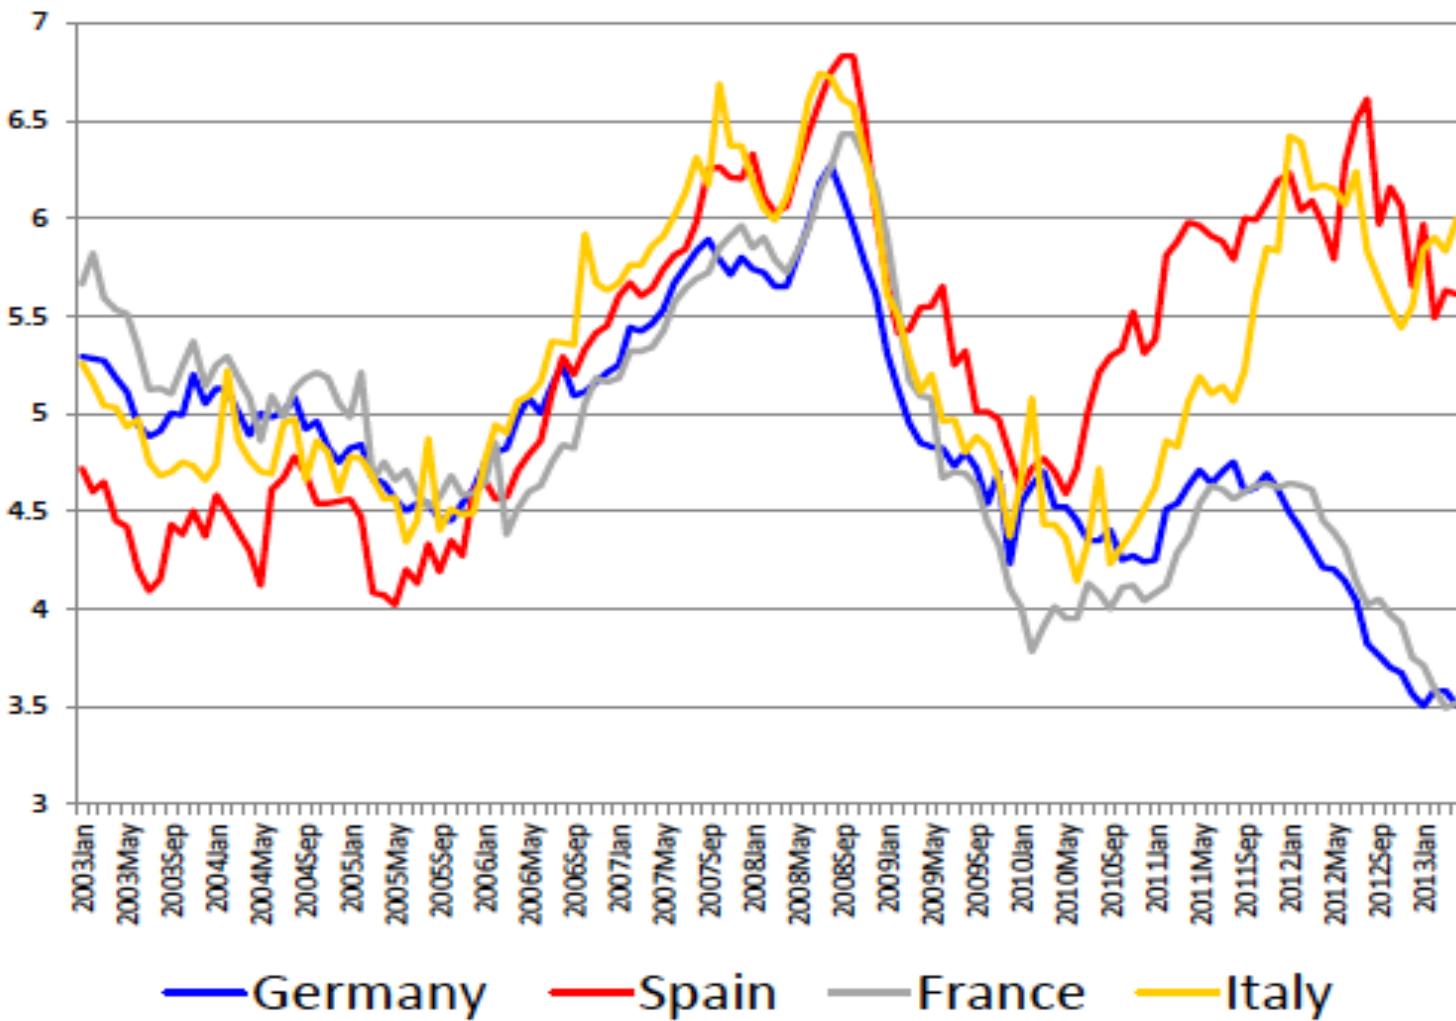

T2: a clearing system that doesn't clear

A fragmented monetary union

MFI interest rates on loans to NFCs

Keynes's Clearing Union

- restricted to current account
- symmetric charges on debtors and creditors
- quotas
- exchange rate adjustments in case of persistent imbalances

From T2 to a European Clearing Union

- cheaper refinancing operations for trade and FDI
- symmetric charges on negative and positive T2 balances
- increasing charges as balances increase in both directions
- real exchange rate adjustments through symmetric budgetary and wage policies

Advantages

- money circulates and isn't hoarded
- external debts are paid and not floated (or bailed out)
- countries converge through a cooperative mechanism
- debtors (and creditors) are freed from deflationary pressures
- creditors benefit, creditors pay
- trade and real investments have cheap and stable finance
- money is sufficient, not too much or too little
- charges on T2 balances can be used to fund EIB and EIF
